Professional Summary

Product-focused Software Engineer whose structural engineering background drives a rigorous approach to building practical software solutions that prioritise real user needs. Partners closely with stakeholders, designers, and users to build features aligned to real workflows and business outcomes. Passionate about reducing operational friction, exploring AI-assisted development, and continuous improvement.

Technical Skills

Backend: C# / .NET (6-10 & Framework 4), Entity Framework (Core & 6), RESTful APIs, Python, OpenAPI, xUnit, NSubstitute.

Frontend: Angular (12–20), TypeScript, JavaScript, RxJS, Angular Material (Material 3), CSS/SASS, Tailwind, Responsive Design.

Cloud & Infrastructure: Azure (App Services, Service Bus), Google Cloud Platform (GCP), Docker, PostgreSQL, SQL Server, RabbitMQ

DevOps & Architecture: Git, GitHub, GitHub Actions (CI/CD), Microservices/Monolithic Architecture, Process Automation, Agile/Scrum

Professional Experience

Dye and Durham (London) – Software Engineer, Legal Tech Solutions

March 2023 – Present

- Re-architected a legacy SOAP integration into a modern RESTful pipeline within a .NET Framework 4 environment, eliminating manual fulfilment for 25+ daily orders by engineering an automated status-polling mechanism via Azure Service Bus to ingest and upload reports and fully remove manual intervention from the workflow.
- Utilised an OpenAPI contract-first methodology for microservice development, establishing API contracts as a single source of truth to drive consistency and accelerate third-party integration. Applied this approach to engineer a scalable national property search API using .NET and standardising fragmented and jurisdiction-specific property data schemas across multiple states into a unified structure that significantly reduced integration complexity for third-party consumers.
- Modernised a large-scale monolithic UI by migrating from Angular 12 to 18 and incorporating the Material 3 design system, resulting in a 100% resolution of critical and high security vulnerabilities; refactored legacy code to remove unsupported node packages, ensuring long-term system maintainability and UI consistency.
- Leveraged AI as a structured reasoning partner, framing complex design problems, stress-testing architectural decisions through iterative dialogue and validating trade-offs before implementation to reduce costly late-stage rework.
- Drove personal productivity by designing agentic AI workflows that offloaded well-scoped, repeatable tasks via structured prompts, preserving cognitive capacity for complex architectural thinking and system design.
- Accelerated delivery by proactively reviewing and questioning design specifications with stakeholders, applying strong communication skills to simplify technical complexity and minimise "scope creep" throughout the development lifecycle.
- Collaborated on a standalone timekeeping frontend microsite using Angular 18, backed by a .NET microservice exposing REST APIs designed documentation-first using OpenAPI, with data persisted in PostgreSQL, and engineered to integrate cleanly into an existing monolithic application.
- Built CI/CD pipelines using GitHub Actions with automated package publishing and mentored peer teams on improvements to build, test, and release workflows.

Robert Bird Group (Brisbane) – Senior Structural Engineer, Construction Engineering

July 2016 - March 2023

- Developed a desktop application with python for engineers to automate data generation from tower crane structural analysis models, helping reduce time for the team to output presentable data by ~67% and saving the company ~£18,000 / year.
- Developed a plugin with a graphical coding tool that produces tower crane lifting capacity charts and radius plans for engineering drawings. This Automated end-to-end data output process, reducing manual drafting time by 50% and saving ~£25,000 per year.
- Led a team of ~10 engineers and drafters on the construction phases, sequencing and temporary retention works on the Woolloongabba Underground Station on Queensland's largest transport infrastructure project, the £3 billion Cross River Rail development.
- Managed and mentored a team of 5 engineers and drafters on tower crane installation service projects globally.

Education and Qualifications

Software Engineering Immersive Bootcamp - General Assembly 2022

Chartered Professional Engineer of Australia (CPEng) - Engineers Australia 2022

Bachelor of Engineering (Honours Class I) - The University of Queensland 2012 - 2016

GPA 6.67 out of 7.0, earnings Honours Class I

Dean's Commendation for Academic Excellence (GPA of ≥6.67 out of 7)

Other Interests/Hobbies

Snowboarding/Skiing, Cooking, Travelling, Pub Quiz, Hiking, Football, Basketball, Beach Volleyball, Golf, Tennis.
